Profile

Senior software engineer and application lead with 5+ years building enterprise software, an MSc in Petroleum Geoscience from the University of Liverpool and earlier oilfield operations experience at Baker Hughes. Lead React and TypeScript development for a production geological data platform spanning ingestion, validation, interactive maps and workflow monitoring. Own frontend and BFF architecture, make product decisions with geoscience stakeholders and mentor engineers. Combine subsurface knowledge with hands-on software delivery for demanding technical users.

Technical strengths

React, TypeScript, JavaScript and Angular • Frontend architecture, performance and testing • Node.js, Fastify and API design • PostgreSQL, Docker and S3-compatible storage • GIS, Leaflet, mapping and coordinate reference systems • Geological data ingestion and validation • SSE and WebSockets • Python scripts for geophysical data • Petrel geological modelling • Technical leadership and mentoring

Professional experience

Frontend and Application Lead | EPAM, Geological Data Platform | Jan 2026–Present

- Led geological data ingestion and map POCs (Jan–Mar 2026) through MVP (Apr–Jun) into production, shaping architecture and application workflows with geoscience domain stakeholders.
- Owned frontend and BFF technical direction for report ingestion, quality checks, user validation and map workflows; turned geological data and ML outputs into reviewable decisions for users.
- Built and guided React/TypeScript and Fastify application work across multipart uploads, ZIP processing, S3 landing-zone integration, PostgreSQL-backed data flows and real-time processing status via SSE.
- Leading map/canvas editing and georeferencing validation for geological layers, geometry and attributes; coordinating data contracts with backend, ML, analytics and product teams.
- Planned delivery across ingestion, monitoring, validation, mapping and integration streams; reviewed code and mentored two junior engineers while working with an additional middle-level engineer.

Senior Frontend Engineer | EPAM, Automotive Marketplace | Nov 2025–Feb 2026

- Delivered customer-facing features, interface improvements and analytics integration for a production marketplace.

Senior Frontend Engineer | EPAM, Baker Hughes OnePM | Apr–Oct 2025

- Modernized an industrial application in Angular; developed real-time collaboration, virtualized data tables and analytical dashboards.

Frontend Engineer | EPAM, Pearson | 2024–2025

- Developed interactive learning experiences in React, including game-based UI and complex interaction logic.

Frontend Engineer | EPAM, Wolters Kluwer | 2022–2024

- Built schema-driven interfaces, form and validation workflows, editable tables and annotation features for a multi-tenant enterprise platform.
- Increased unit test coverage from 30% to 80% while improving maintainability across the application.

Frontend Engineer | EPAM, PTTEP | 2021–2022

- Developed geospatial dashboards with maps and charts, reusable state patterns and performance improvements for an energy-sector client.

Well Completion Field Operations | Baker Hughes | 2013–2015; 2020 (six months)

- Worked in oilfield operations and developed practical understanding of well completion workflows, field data and collaboration with engineering teams.

Education and domain background

MSc Petroleum Geoscience | University of Liverpool, UK | 2019

Modelled a North Sea field in Petrel during MSc coursework; wrote Python scripts to identify geophysical data patterns.

BSc Geology and Geophysics | Satbayev University, Kazakhstan | 2015
